FORECAST OF THE STATE POPULATION BY AGE AND SEX: 2000 TO 2040

NOVEMBER 2011

Discussion of Forecast Model Assumptions

The Office of Financial Management's (OFM) state population forecast is produced with the Cohort Component Model (CCM). This is a sophisticated demographic accounting system that starts with the most recent census counts by single year of age and gender, "survives" the age and gender specific cohorts forward in time, incorporates fertility and migration trends, and forecasts the total population forward combining all these inputs. This November 2011 forecast is the first in the current decade to be benchmarked to 2010 Census population counts; it is also the first forecast extending to year 2040. The existing assumptions in the CCM have been evaluated and modified this year to incorporate new information from 2010 Census data.

This document provides annual population age- and sex-specific forecasts from 2000 to 2040. Technically, population figures between census years are referred to as "estimates" rather than "forecasts."¹ The 2001 to 2009 population estimates in this report have been revised since the last forecast using actual births, deaths and residual migration data, and have been smoothed between 2000 and 2010 census data points with standard intercensal interpolation methods. 2011 numbers are from OFM's 2011 April 1 population estimates. Forecasts begin in 2012.

Fertility assumptions: Washington State's total fertility rate (TFR) is expected to stay at current near-replacement levels, due to continued increases in female labor force participation and educational attainment, which generally result in women delaying childbearing and having smaller families. The TFR used in this forecast is 1.975 children per woman at the beginning of the forecast period with gradual upward adjustments to 2.0 by 2030. This assumption is consistent with the projected national TFR from the U.S. Census Bureau 2008 forecast, with minor adjustment based on historical differences between fertility trends in Washington and the U.S. as a whole.

While Washington State saw a significant increase in the number of births between 2005 and 2008 as a result of the offspring of the baby boomers reaching childbearing age and starting families, that trend reversed in 2009 and 2010, leading to a recent decline in births. This decline is considered temporary due to heightened levels of uncertainty with regards to the direction of the economy, and has not been used to adjust TFR assumptions in the current forecast. Updates of TFRs will become necessary only if a long term trend develops in the future.

¹ *Population estimates* are figures developed for current or prior years. Estimates are largely developed from actual administrative data sets that reflect population change. The assumptions in population estimates generally reflect statistically-based and ratio-based relationships between population and indicator data such as housing, tax filers, or voters. Thus, estimates are based on actual data and the assumption is that previously established relationships will continue. *Population forecasts* are future population expectations. While growth assumptions are usually developed from prior growth trends, the forecast figures are not grounded on actual events and current data. Population forecasts are often developed from forecasts of specific data sets that are related to population change.

Even though fertility rates are projected to remain largely constant, the number of women at child-bearing age is expected to continue growing, so the number of births is expected to increase in the future, with forecasted annual births likely to reach 99,600 per year by 2030 and 107,600 by 2040.

Mortality assumptions: Washington State's crude death rate (CDR) is expected to increase slightly from 7.1 to 8.0 per 1,000 persons by 2020, but afterwards, the CDR is expected to climb to 10.5 by the end of the forecast horizon. Two factors affect this trend in the state's future mortality: changes in life expectancy and changes in the age structure of the population. While the life expectancy between 2010 and 2030 remains unchanged from the last forecast, it has been adjusted slightly upward for 2030 to 2040 under the assumption that people will live longer due to advanced medicine and healthy lifestyles. These adjustments are based on Social Security Administration intermediate mortality projections (Table V.A3 of the 2011 OASDI Trustee Report). At the same time, however, Washington state population is aging rapidly between 2010 and 2040, with expected growth of approximately 125 percent in the 65 and over population. The rise of the CDR is primarily due to this significant increase of elderly population, whose mortality risk is much higher than the general population.

Net migration assumptions: Net migration is an important, but difficult to predict, component of population change. To forecast short term migration, OFM uses an econometric model which weighs Washington's relative attractiveness to job seekers against that of California and other states. This short term migration forecast is transitioned into long term migration expectations based on historical data which indicate that net migration is likely to reach 42,000 persons per year by 2016 and stabilize around 45,000 in 2025. Figure 1 shows that OFM's migration model has tracked actual migration well for the last thirty years.

Both the short and long term migration expectations in this year's forecast have been adjusted downward as compared to previous forecasts (see Table 1), with several conditions determining this decision. Firstly, the negative impact of the current extended period of unemployment on people relocating for work is expected to linger longer than for any other time in recent history. Secondly, with Washington population continuing to shift toward older ages, the overall mobility of the population is expected to decrease. Thirdly, international immigration has decreased since 2008 due to policy and economic factors, and if policy continues to move toward more strict controls, international immigration is not likely to reach pre-recession levels even if the economic situation does improve. Finally, in the long run, economic conditions in immigration-sending countries may improve as they continue to develop economically, which would make moving to the U.S. (and Washington) less desirable.

Figure 1. Comparison of Actual and Modeled Net Migration, 1980-2011 (with Forecast Migration)

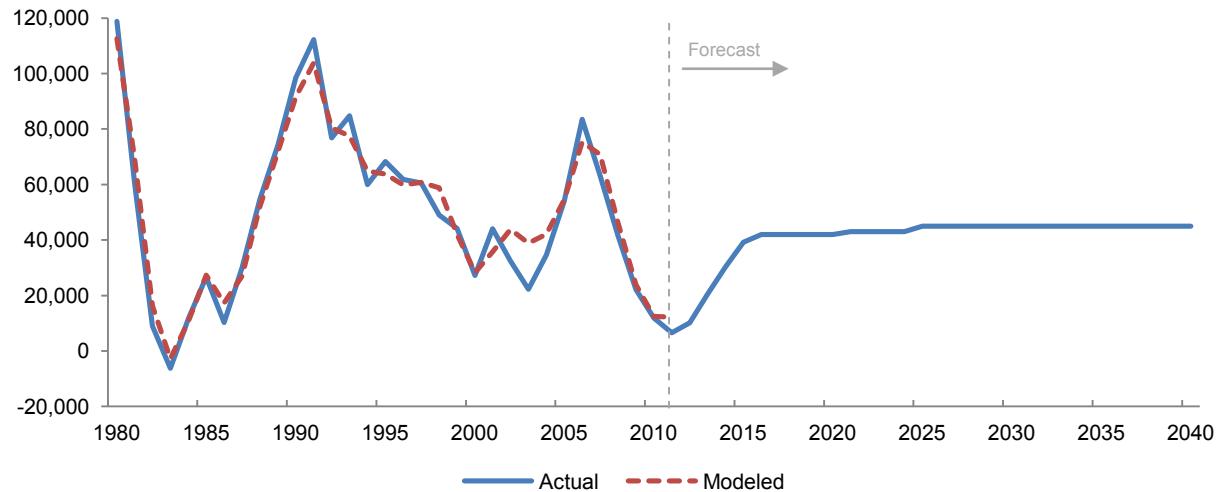

Table 1. Change in Net Migration Assumptions Compared to Prior Forecast

Year	2011	2010	Diff.
2008-09	22,192	38,878	-16,686
2009-10	11,638	24,123	-12,485
2010-11	4,809	28,200	-23,391
2011-12	10,100	36,000	-25,900
2012-13	20,500	50,300	-29,800
2013-14	30,300	48,100	-17,800
2014-15	39,200	48,100	-8,900
2015-16	42,000	48,100	-6,100

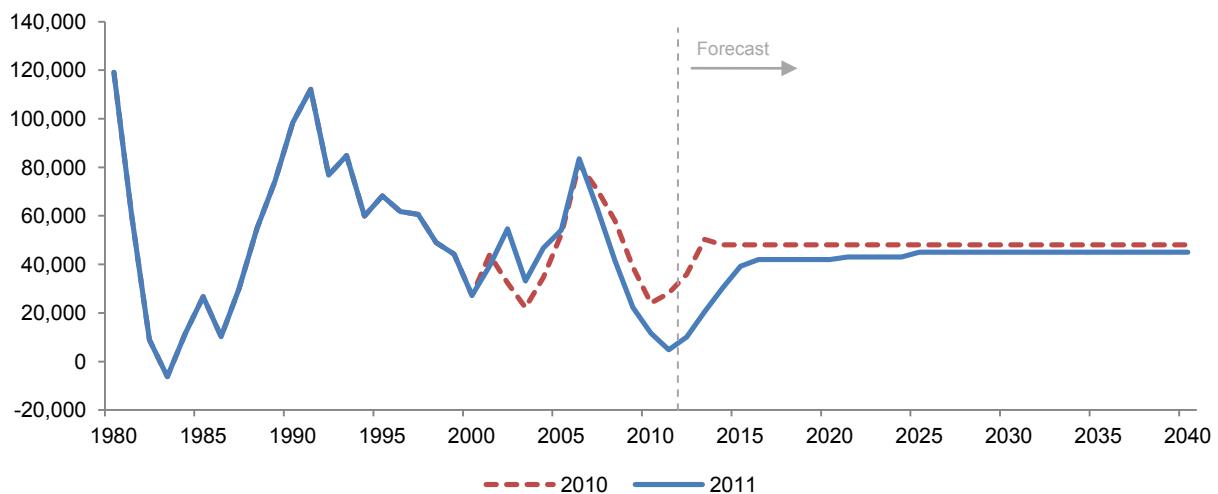

Table 2 shows that even though Washington has better employment growth compared to both California and the nation as a whole, the difference has become less pronounced during the current period of extended unemployment. When employment opportunities become limited the state's pulling power decreases relative to other states. Therefore, the state is not expected to attract as many migrants as was projected in 2010.

Table 2. Annual Employment Growth Comparison

Year	Over-the-Year Change (%)			Difference	
	Washington	California	US	WA-CA	WA-US
2000-01	-2.78	-2.51	-2.65	-0.27	-0.13
2001-02	-5.00	-6.24	-5.36	1.24	0.36
2002-03	-1.76	-3.85	-3.20	2.08	1.44
2003-04	1.60	-1.08	-0.22	2.69	1.83
2004-05	3.54	0.78	0.85	2.76	2.68
2005-06	4.52	1.06	1.24	3.46	3.28
2006-07	3.23	0.09	0.38	3.13	2.85
2007-08	1.13	-0.54	-0.99	1.67	2.12
2008-09	-5.98	-7.19	-6.92	1.20	0.93
2009-10	-0.43	-0.85	-1.08	0.42	0.65
2010-11	3.03	1.41	1.24	1.62	1.79
2011-12	2.57	2.70	1.62	-0.13	0.95
2012-13	2.98	2.24	2.18	0.75	0.80

Figure 2 compares the current migration expectations again those from November 2010 forecast. Net migration between 2011 and 2012 is expected to be 10,100, instead of the previous forecast of 36,000 (see Table 1).

Figure 2. Net Migration Forecast Comparison: 2010 vs. 2011

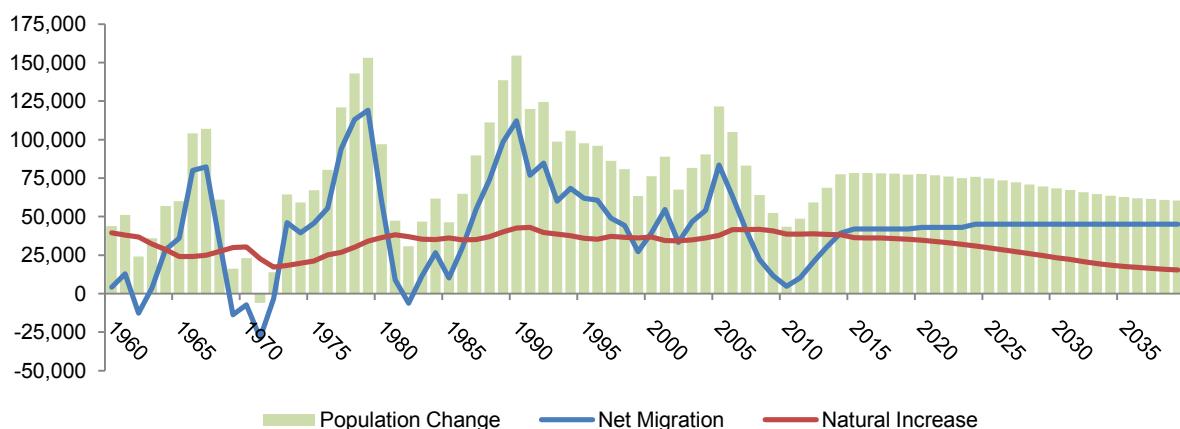

Needless to say, there is a considerable amount of uncertainty in any forecast being developed at the present time, and this uncertainty is especially pronounced in the migration component. There is no precedent for the current national financial crisis, and there is considerable speculation on how long and how severe the economic and social impacts might be by the time we return to high employment. Migration to Washington will be tracked closely during forecast updates, and revisions will be made if necessary.

Discussion of State Growth and Components of Change

Figure 3 illustrates the demographic components of change in Washington's population and Table 3 provides the details of the population change. Over the thirty year forecast period, Washington State's population is expected to grow by just over 2.0 million, reaching 8,791,000 in 2040. Based on the migration assumptions adopted in this forecast, net migration contributes 1.2 million, or 58 percent, to the overall population increase during the 2011 to 2040 period. The other 42 percent will be contributed by "natural increase," which is defined as the number of births minus the number deaths.

Figure 3. Annual Population and Components of Change

In Washington, natural increase is expected to decline from 38,600 in 2011 to 15,500 by 2040. This forecasted decline in natural increase is due to the interaction of births, deaths, and age structure in the population. While births are forecasted to continue to increase, reaching 107,600 by 2040, natural increase will still decline because the death rate is expected to increase from 7.1 per 1,000 persons in 2011 to 10.5 in 2040 as the proportion of elderly in the population increases with the aging of the baby boomers.

Figure 4. Historical Trends and Forecasted Changes in Natural Increase

Notes: 1) Unrounded data are not meant to imply accuracy. 2) Rates computed per 1,000 population at midpoint of time period. 3) Totals may not add due to rounding.

Dependency Ratios and an Aging Population

Demographers use the idea of a “dependency ratio” to measure the proportion of a population dependent on the rest of the population for support. Children (ages 0 to 17) and the aged (ages 65 and over) are defined as dependent populations. As the baby boom generation ages, Washington’s population will have a larger share of elderly in the total population. Table 4 indicates that the dependency ratio for young people will remain stable over the forecast period, but the dependency ratio for the aged will increase dramatically from about 20% to 37%. Because of this increase in the aged dependency ratio, the total dependency ratio will go from 56% to 76%, implying that, by 2040, only 24% of the population will be supporting the other 76%.

Table 4. Dependency Ratios over Forecast Period

Year	Child	Aged	Total
2011	36.3%	19.6%	55.9%
2015	36.4%	23.2%	59.6%
2020	37.3%	27.8%	65.1%
2025	38.4%	32.5%	70.9%
2030	39.0%	35.9%	74.9%
2035	38.9%	37.1%	76.0%
2040	38.6%	37.1%	75.6%

Discussion of Age-Specific Populations

Within the total population, different age groups require different services and make different contributions with respect to the economy and society. Figures 5 through 8 in the following pages display the annual population change for the age groups which have the largest impact on state programs: school-age children (5 through 17), college-aged people (17 through 22), seniors (65 and over), and the most-elderly (85 and over). Tables 5 through 8 provide total population figures for each age group over the forecast period with intercensal estimates provided prior to 2010.

School-Age Population

Persons age 5 through 17 represent the school-age population in kindergarten through 12th grade. There are an estimated 1,135,200 youngsters ages 5 to 17 in 2011. The school-age population is expected to start increasing in 2013 with an average annual gain of approximately 10,000 persons per year through 2024. By 2025, this population is expected to reach 1,265,100. This growth is due partly to the grandchildren of the baby boom generation reaching school age (the “third wave” of the baby boom.) By 2040, the number of school age persons will be about 1,395,600.

Figure 5. Annual Change in Population Ages 5-17

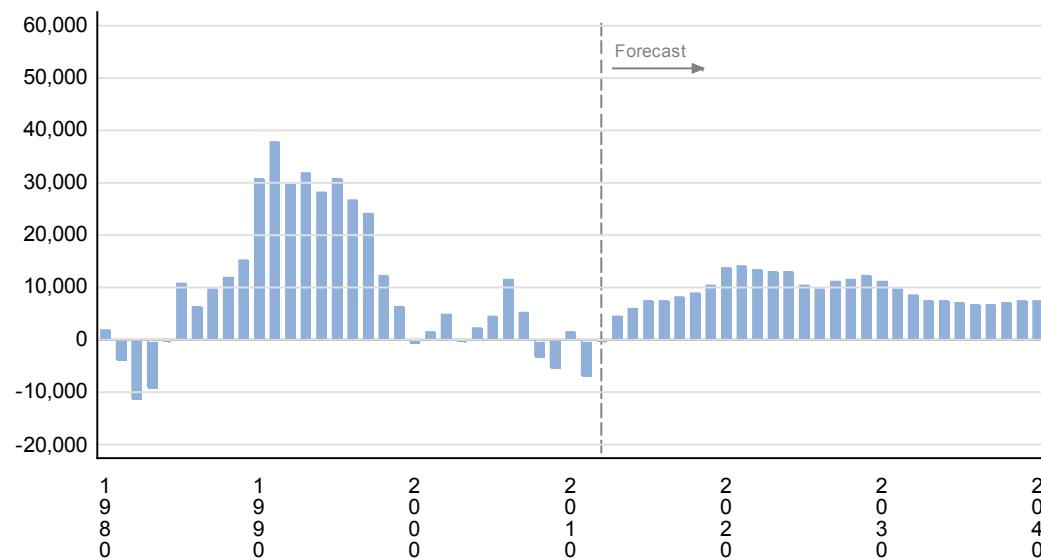

Table 5. Population Ages 5-17

Year	Year	Year	Year	Year	Year	Year	Year
1980	833,237	1990	893,252	2000	1,119,533	2010	1,141,697

College-Age Population

Persons age 17 through 22 comprise labor force entrants, young workers, and the primary users of post-secondary college and university facilities. There are an estimated 559,400 persons of age 17 through 22 in 2011. After a long decline, this population began to increase in 1995, but growth went flat again in 2008. This population shows modest declines through 2016, but in 2017 this population starts to grow again, continuing steady growth through the remainder of the forecast period, and reaching about 652,800 by 2040.

Senior Population

Washington's population is aging, which is a major demographic development which will have profound implications for policy-making and planning at all levels of government. In 2011 there are about 852,000 persons age 65 and older, representing 13 percent of Washington's total population. Growth in this age group will increase as the baby boom generation enters retirement years, with an annual gain of about 42,000 in 2012 and peaking at 49,000 per year in 2020. By 2040, the elderly population is forecast to reach 1,855,500, representing 21 percent of the state's total population, in contrast to 13 percent in 2011. Note that the sharp spike in 65+ population growth in 2011 corresponds to a similarly sharp spike in births 65 years ago in 1946, exactly one year after American servicemen returned home from World War II. These children of 1946 turn 65 in 2011, leading the baby boomer generation into retirement.

Most Elderly Population

Assisted living, skilled care, and the medical needs of the population age 85 and over are some of the largest expenditure challenges facing Washington and the nation as a whole. This population, numbering about 120,600 in 2011, is expected to increase by 217,500 persons over the next three decades, reaching 338,100 by 2040. Most of this growth will occur after 2020 as the baby boom cohorts begin to enter this most-elderly group.
